

Game-Changrs Simplified System Map

One useful simplification: you do not have many unrelated apps. You have **one main web app**, **one analytics backend**, **one local operator console**, **one worker pipeline**, and **two data domains** behind them. This page shows where each one is and what it connects to.

Public Domain: `game-changrs.com`

Hosted API: `gamechangrs-cricket-api.onrender.com`

Primary Branch: `main`

Core System

CORE PART	WHAT IT IS	WHERE IT IS	CONNECTED SERVICES
Main Web App	Main Game-Changrs site and signed-in app. It includes Analytics, Coaching Marketplace, Gear Marketplace, and Technique AI.	Repo root frontend, live at <code>game-changrs.com</code>	Supabase main app, Render analytics API, Lovable publish, Google sign-in
Analytics Backend	Serves analytics pages, player reports, and report HTML/data.	<code>bay-area-u15/apps/api</code> , hosted on Render	Analytics DB, main app Supabase auth, Render
Local Operator Console	Internal admin/operator tool to add series, refresh data, validate, and publish.	<code>bay-area-u15/apps/api</code> , local only	Analytics DB, local env, worker pipeline
Worker Pipeline	Background jobs for discovery, ingest, compute, scoring, and intelligence generation.	<code>bay-area-u15/apps/worker</code>	Analytics DB, local-ops flows

Connected Services

PLATFORM	WHY YOU USE IT	WHERE IT CONNECTS
Supabase	Auth, app tables, storage, edge functions, and analytics Postgres.	Main web app + analytics data layer
Render	Hosts the analytics backend.	Analytics backend
Google SSO	Lets users sign in with Google.	Main web app auth
Resend	Sends report and transactional emails.	Edge functions + report delivery flows
Lovable	Frontend publish/project surface.	Main web app delivery
IONOS DNS	Owns domain and DNS records.	<code>game-changrs.com</code> routing and verification
GitHub	Stores code history and restore anchor branches.	All code and backup history

Canonical simplified map for backup, restore, and operator understanding.

CORE SHAPE

1 + 3

1 main web app and 3 supporting service layers behind it.

DATA DOMAINS

2

Main app data and separate analytics/local-ops data.

CONNECTED PLATFORMS

6+

Supabase, Render, Resend, Google SSO, Lovable, IONOS DNS, GitHub.

Two Data Domains

DATA DOMAIN	WHERE	MAIN USE
Main App Data	<code>tpiegapsjeetvwsybjiu</code>	Auth, coaching, gear, Technique AI, storage, edge functions
Analytics Data	<code>azgebbtasywunltdhdby</code>	Series data, reports, player intelligence, local-ops workflow state

Layman view: the app uses **two separate back-end data homes** so the business app and the cricket analytics engine stay separated.

Git And Recovery

main is the branch to think of as your current source of truth.

17 local branches and **15 remote branches** are present right now.

Major historical work sits in **phase9-analytics-clean**, **phase10-entity-series-deploy**, and **cutover-main-push**.

The **backup/*** branches are checkpoint and restore-point branches.

For restore, the key docs are the restore guide, Codex restore prompt, local-ops guide, and this system map.

Backup email should attach: restore guide, Codex prompt, and system map.
